

The Prevalence and Impact of Obesity in an ANZ Cohort of patients with IBD

Kaazan, P, Su W, Wilson W, Dinoy E, Wark G, Walker G. Forbes A, Schultz M, Yap J, Rayner CK, Lawrence I, Dutt S, Lynch K, Brett L, Begun J, Andrews JM, Connor SJ

INTRODUCTION

Obesity:

- 1. Is a global issue affecting 31% of Australians
- 2. Affects 15-40% of people with inflammatory bowel disease (IBD)
- 3. Is thought to have deleterious effects on IBD course and pathogenesis
- 4. Australian data investigating its impact on IBD are lacking.

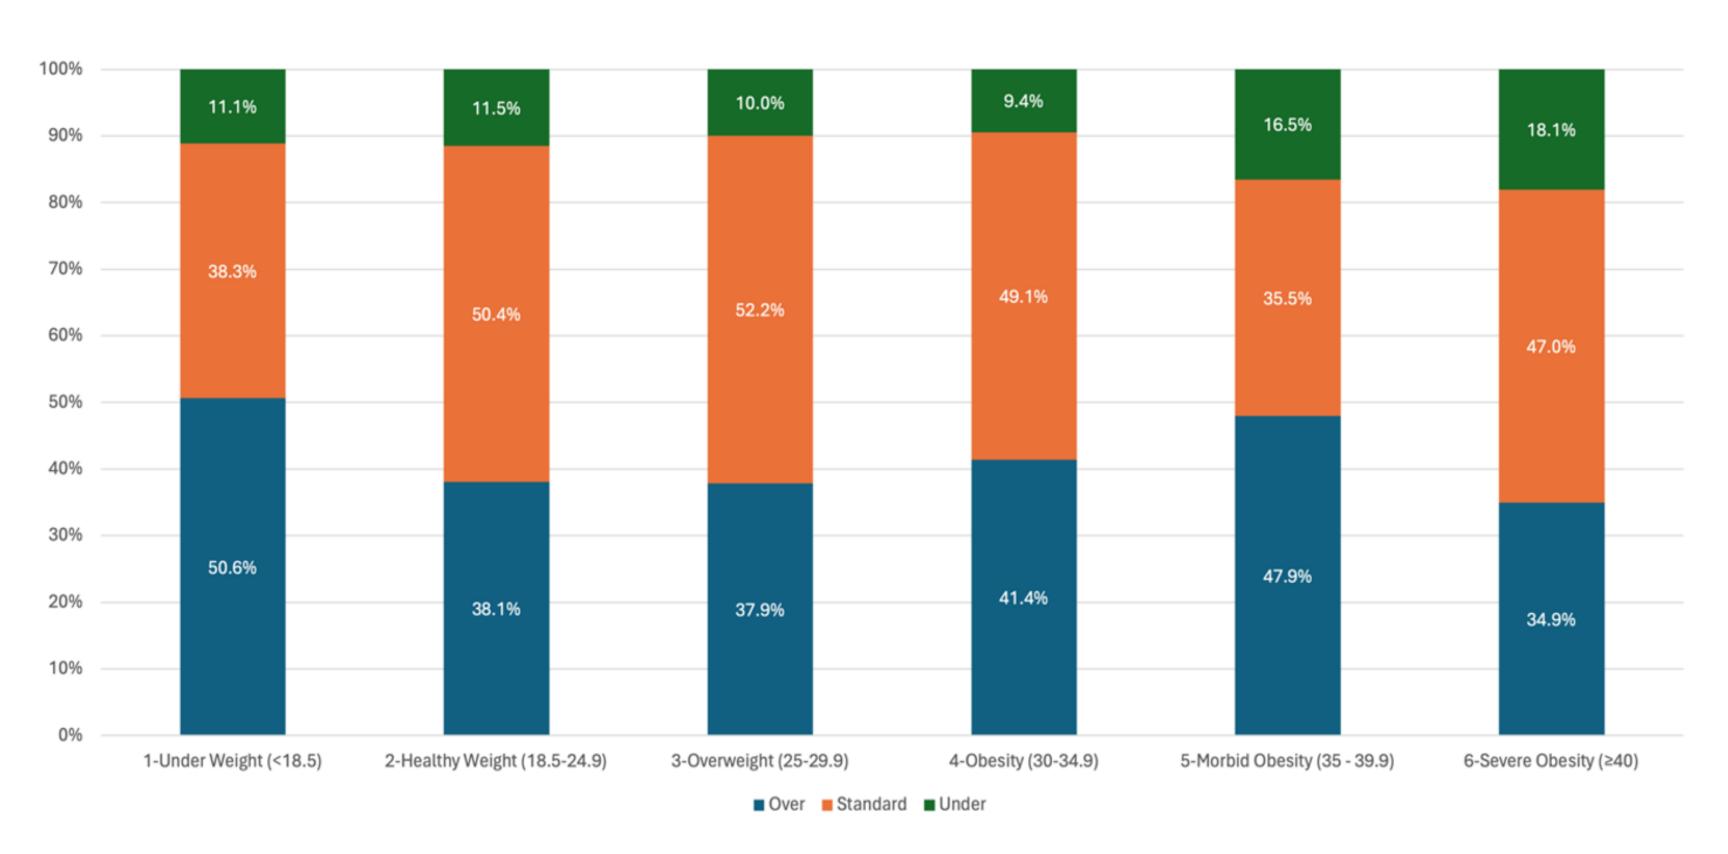

AIMS

- Assess the prevalence and severity of obesity in the Crohn's Colitis Care(CCCare) IBD cohort
- Explore potential influence of obesity on real-world, observed dosing of advanced therapies.

METHODS

- Data collected during routine care using CCCare, an IBD cloud-based electronic medical record
- The de-identified clinical quality registry was interrogated in April 2024.
- People with IBD under active care (encounter within 14 months) were included.

Figure 1: BMI Groups and Dosing of Advanced Therapies

RESULTS

- A total of 4,763 people were included
- 87.1% resided in Australia and 12.9% in New Zealand
- 50.6% of patients were on an advanced IBD therapy
- 56% of patients were obese and overweight
- Median BMI and distribution amongst BMI categories were similar across countries and IBD treatment sites
- There was a statically significant difference in dosing of advanced therapies across different BMI groups (chi² = 23.5, P<0.05).
- Both In the underweight and morbidly obese groups, more people received dose escalation and fewer received standard dosing.

Table 1: Summary of Patient Characteristics

Characteristic	Median (IQR)
Age (years)	41 (30-55)
BMI (kg/m²)	25.7 (22.6-29.4)
Disease duration (years)	10.8 (5.4-18.8)
Characteristic	Frequency
Chron's Disease	2785 (58.5%)
Ulcerative colitis	1857 (39%)
IBDU (1997)	121 (2.5%)
Female	2287 48.3%
Male	2446 51.7%
BMI Classification (kg/m²)	
Under weight (BMI < 18.5)	164 (3.4%)
 Healthy weight (BMI 18.5 – 24.9) 	1936 (40.6%)
 Overweight (BMI 25 – 29.9) 	1570 (33.0%)
 Obese (BMI 30 – 34.9) 	
	701 (14.7%)
 Morbid Obesity (BMI 35 – 39.9) 	228 (4.8%)
 Severe Obesity (BMI ≥ 40) 	164 (3.4%)

CONCLUSIONS

- Largest Australasian study assessing obesity in IBD
- Overweight and obesity prevalence was 56%, correlating with global reports.
- Extreme BMI values appear to affect dosing of advanced therapies.
